7. Enology Production: Status of Dissolved Oxygen in Ohio Table Wines at Various Stages of Vinification with an Emphasis on Bottling

Although dissolved oxygen is favorable at the beginning of fermentation, further aeration produces several adverse effects. Thus, the quality of table wines improves when air exposure is limited. Oxygen levels are especially critical at bottling with importance on shelf life stability and aging potential. Contractor has accomplished both written and preliminary bottling surveys of the industry indicating this as a problem in FY 14. Contractor will continue to place a significant effort on surveying a greater amount of Ohio commercial wineries in regards to oxygen absorption at bottling. Based on individual winery results, bottling line audits and oxygen pickup in the cellar will be performed.

***MUTUALLY AGREED UPON PROVISION**

It is agreed that any equipment valued over \$500 purchased by the Contractor for use on the specified projects in the Contract is the property of the Ohio Grape Industries Committee.

*Indicates change 10/27/14.
